

Documentation

Deep technical documentation for the Location Tracker project. Read in this order if you are new:

1. [DEVELOPER GUIDE.md](#) — the whole system: architecture, the iOS background-execution model, the scenario matrix, and how to build/sign/deploy.
2. [SETUP GUIDE.md](#) — every environment and every command: local server, WSL + xtool toolchain, signing/sideload, AWS EC2, git, troubleshooting.
3. [CLIENT INTERNALS.md](#) — the iOS app file by file, variable by variable, function by function, plus a guided walk through the exact Swift/iOS commands that turn each capability on.
4. [SERVER INTERNALS.md](#) — the ASP.NET Core backend file by file: pipeline, auth, ingestion, trip detection, Kalman smoothing, rate limiting, background sweeper.
5. [FEATURES AND LIMITS.md](#) — what works, the deliberate limits, the hard iOS platform limits (and why), what's missing, what's blocking each gap, and priorities.

The top-level [../README.md](#) remains the quick-start and API reference.
